**Ask for examination of Sagittal Analyser**  
**Detailed Action 03/16/99**  
**Group III and IV mainly**

Dear Sir,

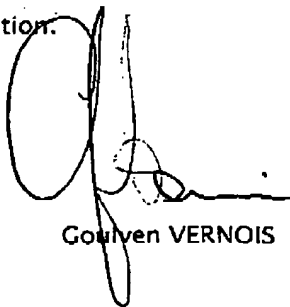

In the application filed in USA was described means to control the shape of the membranous mirror.  
These means are mainly discribed in Groups III and IV.

The claimed invention differs from former art, and so from the present art, by the point to point examination of the sagittal segment, as in Foucault's method.

The invention claims the examination of the sagittal segment without physical moving of a screen.

I ask for examination of this invention.

Truly Yours

Goulven VERNOS
